DXA Bone Densitometer Service Policy

As my patient, I want to provide you with the best care possible. There may be certain services offered such as a radiographic evaluation to detect bone loss leading to a condition called Osteoporosis. Bone Mineral Density (BMD) is monitored by an X-Ray scanner called DXA Bone Densitometer. I feel this radiographic evaluation is necessary for the maintenance of good health and will only be performed if you are in an increased risk category for developing osteoporosis. This service offered may not be covered by your private individual/group insurance contract or considered reasonable and necessary under Medicare program standards. We would like to make you aware that most insurances do pay for this procedure but only **once every two years**. If your insurance rejects your claim due to frequency, we will bill you \$158.00 for your Bone Density test.

Bone Density plays an important role in the diagnosis, treatment, early detection and prevention of osteoporosis. **However, if your insurance contract or Medicare denies coverage/payment you will be expected to pay for this service in full.**

I have read your policy and agree to personally be responsible for payment in full for this service if not covered by my insurance contract.
